Grp 2: India has taken a great initiative to vaccinate all its citizens against covid 19. For or against

First of all I would like to say that we are living in a country which has the second largest population after china and

I think in such scenario where we have a population of 1.38 billion I think we are heading in the right direction as a country in vaccination. Though there are many people who are still not vaccinated, and will be vaccinated in upcoming days but the govt is trying its best to provide vaccine to each and everyone. Now we can also see many educational institution many organizations have also opened the vaccination drives which according to me is a great initiative. Because its really difficult to vaccinate 1.38 billion country in one go. Now many can mention that yes we are not getting free vaccination which we should have got but you have to understand the economic condition of our country as well. And you have to vaccinate 1.38 billion people. The government is also importing vaccines from other different countries and they also need the money for that.

As the country faces the deadly second wave of coronavirus, India has become the second country after the United States to cross 20 crore cumulative COVID-19 vaccination coverage. Ministry of Health and Family Welfare on Wednesday informed that 42% population above 60 years have received their first dose of the vaccine.

"India is the second country after the USA to achieve this coverage in just 130 days. The US took 124 days to reach the 20 crore mark," Ministry of Health and Family Welfare said.

As the covid-19 vaccination drive continues across the country, the drive-in vaccination centres set up by the Brihanmumbai Municipal Corporation (BMC) for specially-abled people and senior citizens have won praise online.

In a tweet, the BMC shared details about a drive-in vaccination centre for the elderly and specially-abled where they can get the vaccine without getting out of the vehicle or standing in a queue.
